

DRD v3

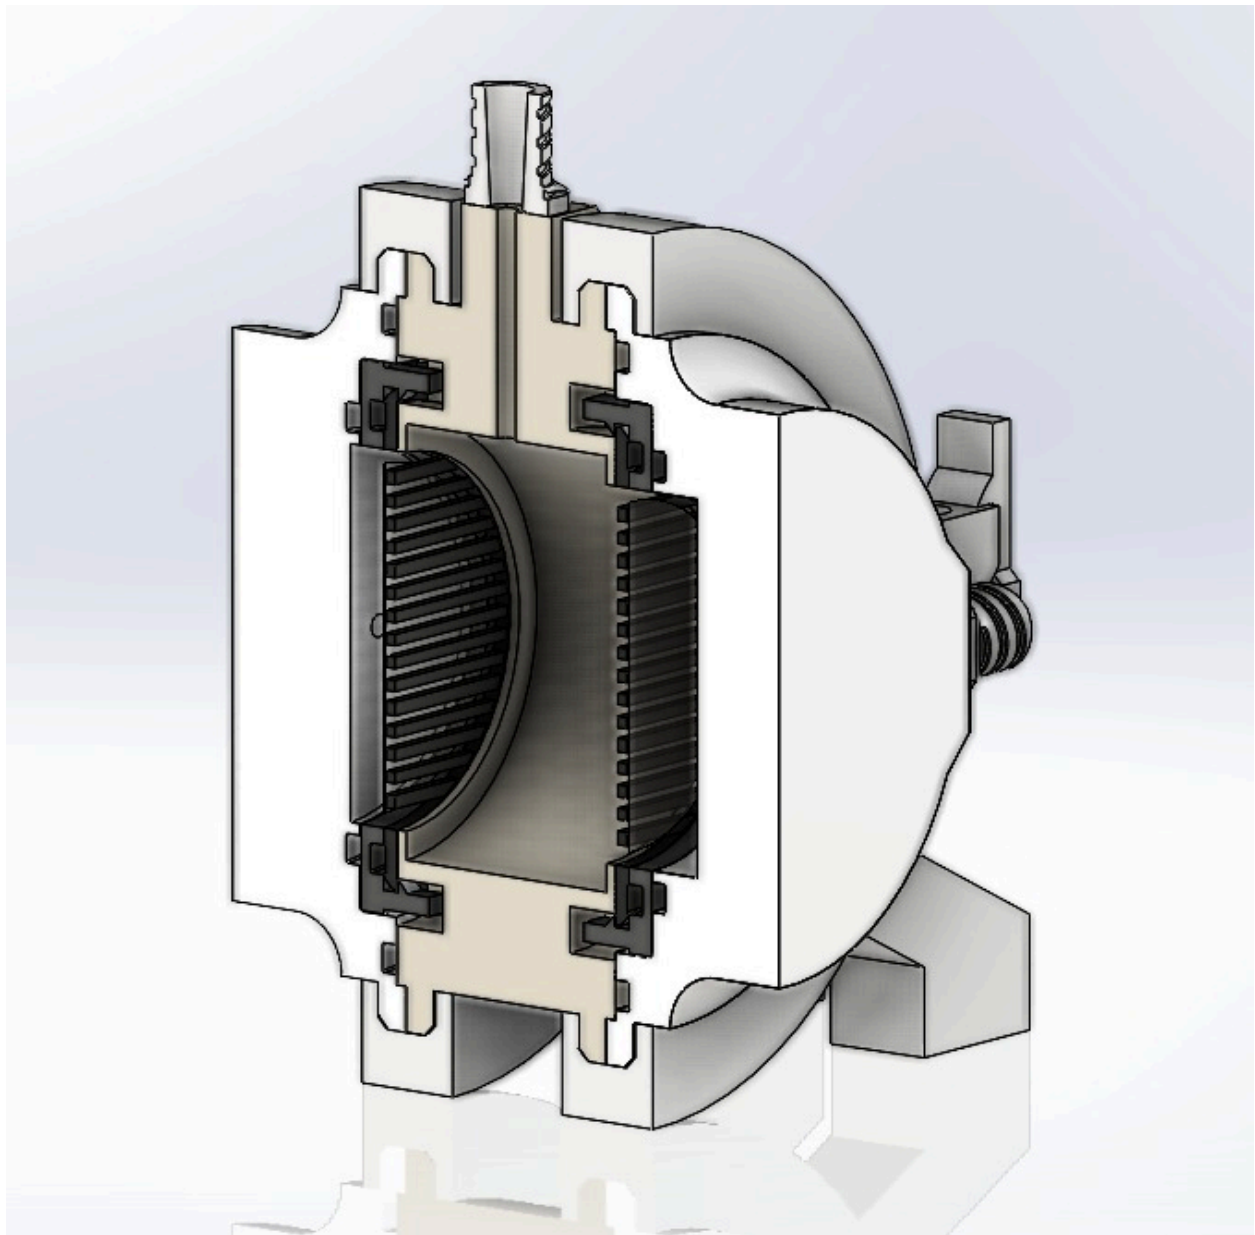

Entire assembly

1. (section view, as seen from the side):

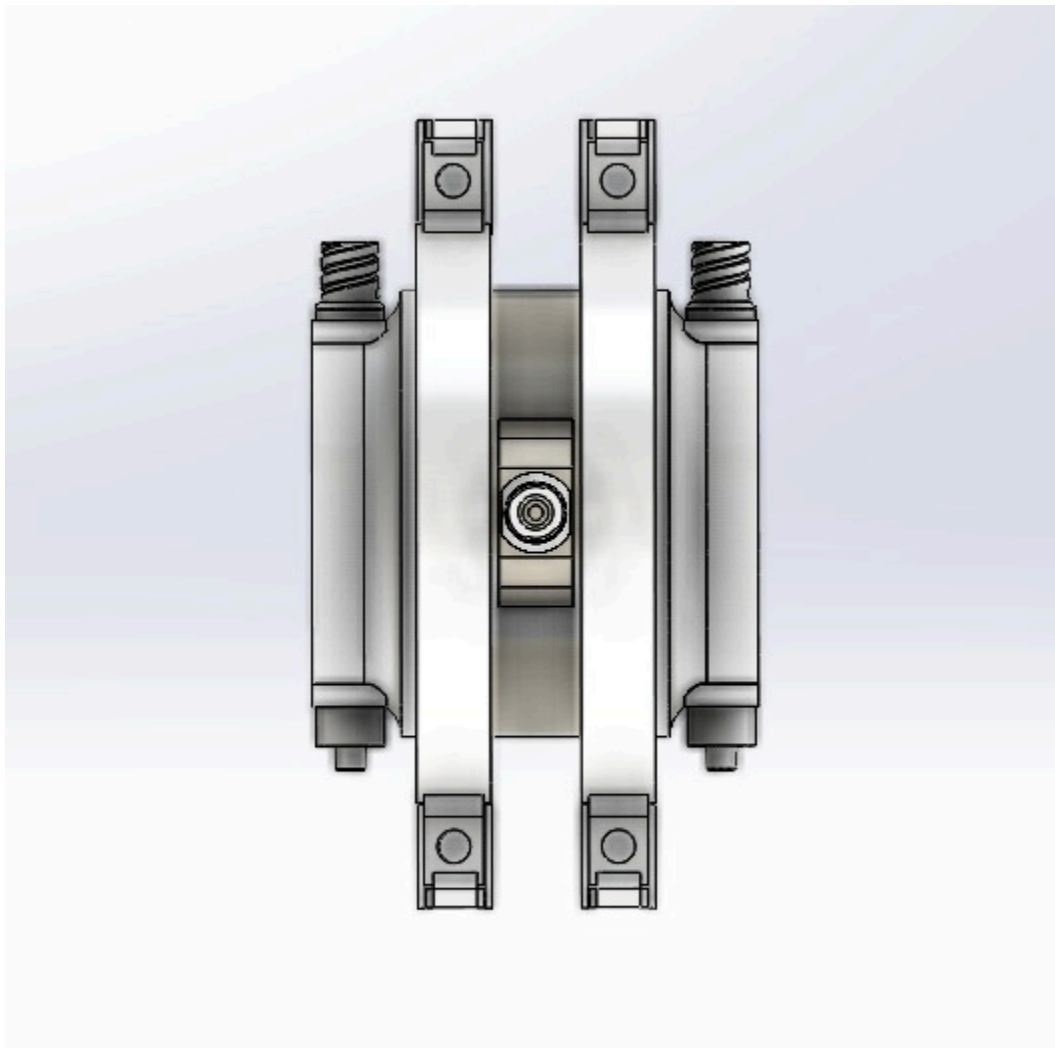

Overall num: 1

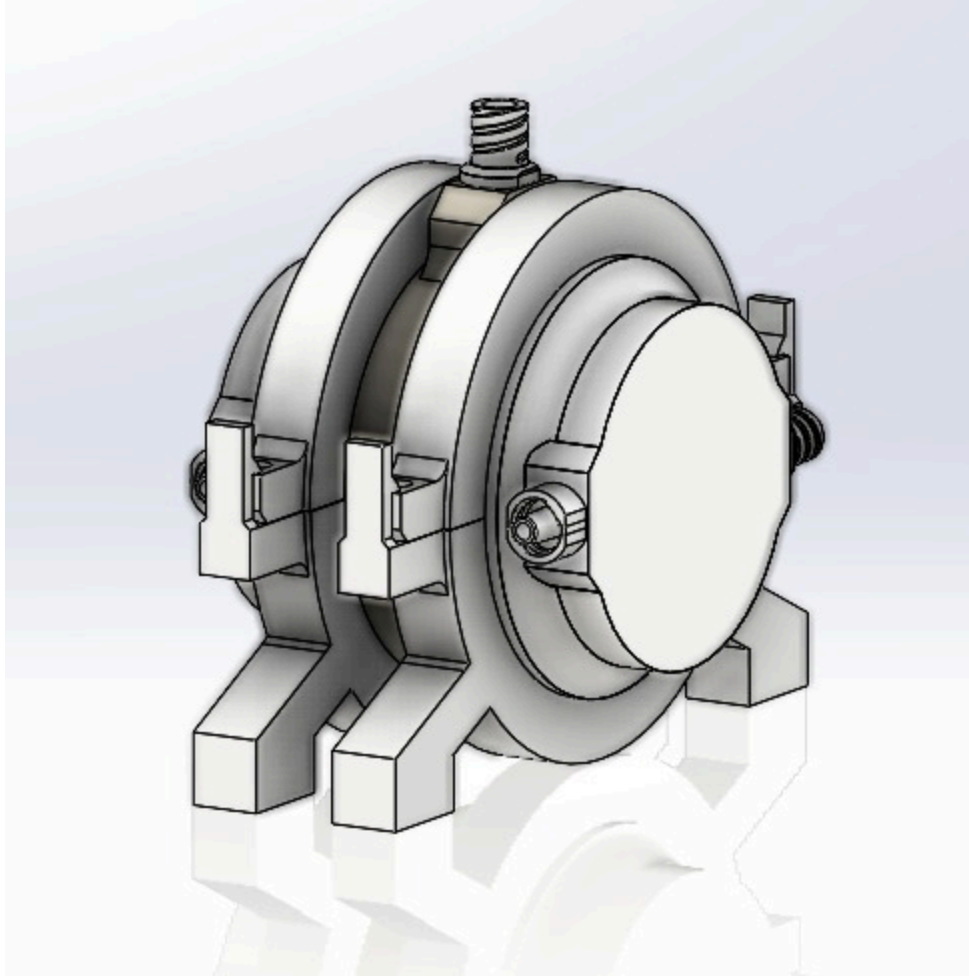

2. Section view from the side still, but at an angle so membranes and everything is a little more visible (*Overall num: 2*)

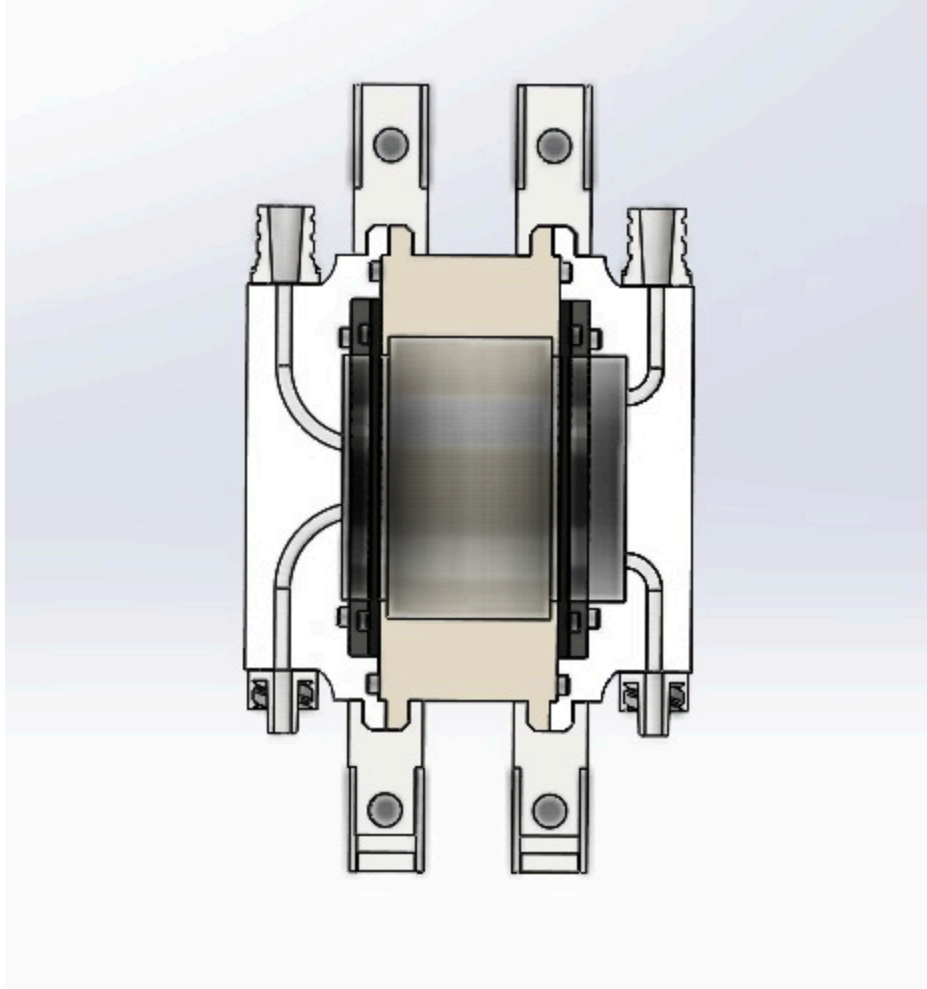

3. Top-down, Bird's-Eye view (*Overall num: 3*)

4. View from the front/back and the side (non-section), entire DRD(*Overall num: 4*)

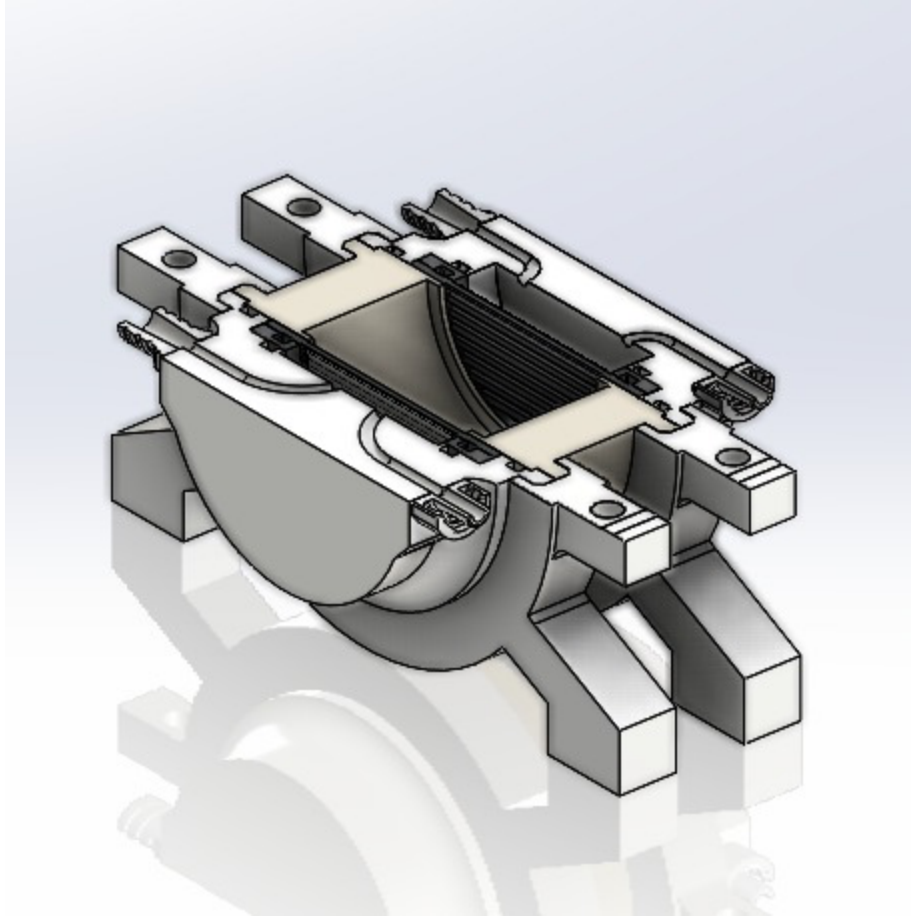

5. Top-down, bird's eye view but of sectioned cut (i.e. split at middle) - annotated (*Overall num: 5*)

**NEED TO ANNOTATE THIS ONE LIKE THE
LAST ONE (SHOW WHICH IS WHICH
COMPARTMENT)**

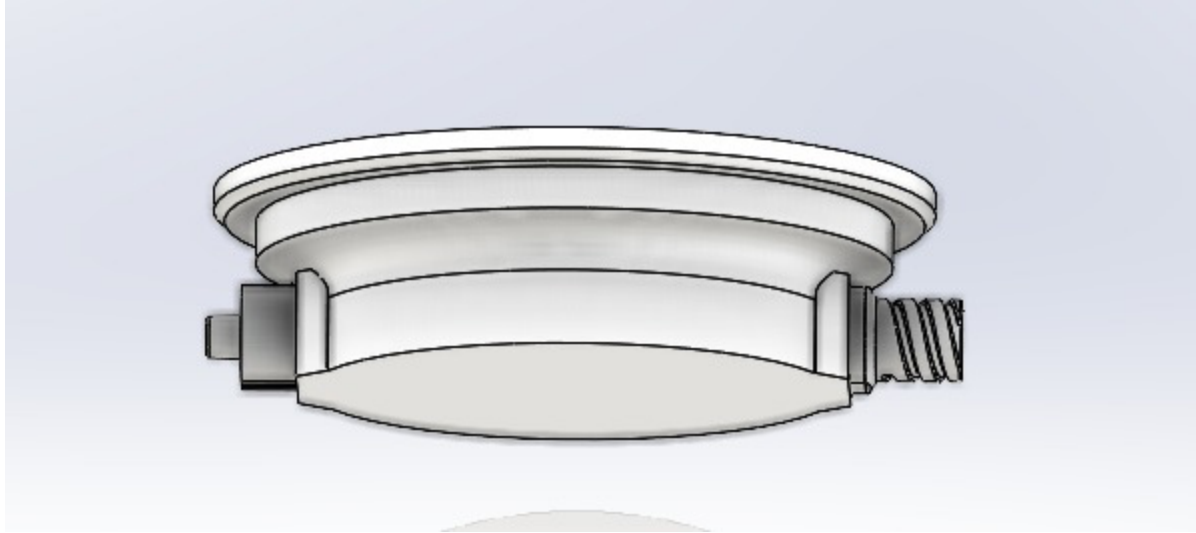

6. View from the side, top - sectioned (*Overall num: 6*)

7.

PERFUSION CHAMBER:

1. Top-down view (bird's-eye) (*Overall num: 7*)

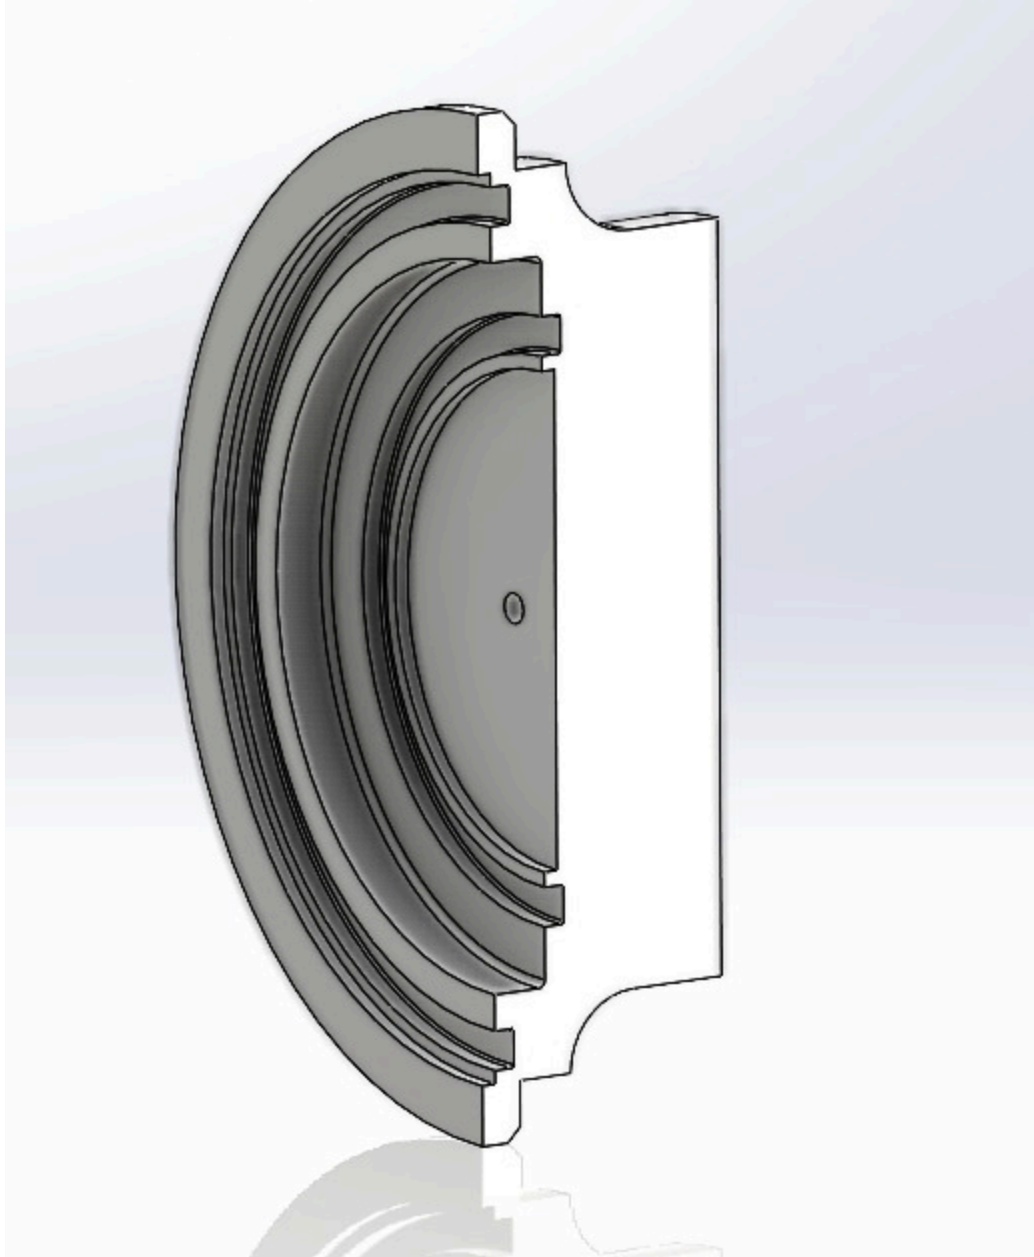

2. View from the side/back at an angle (*Overall num: 8*)

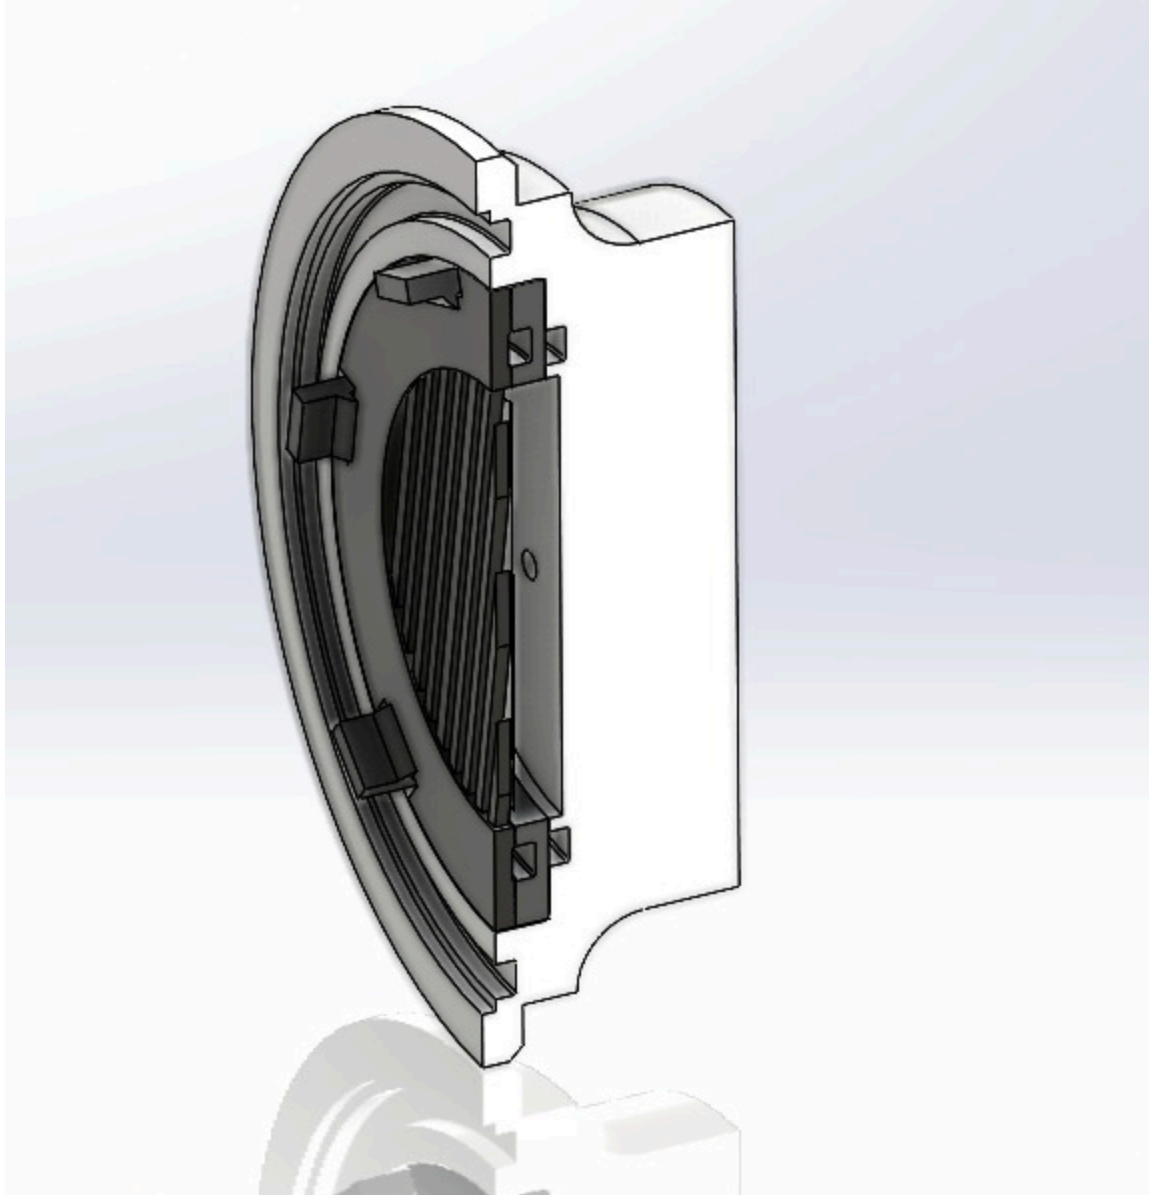

3. View from the front/side at an angle (*Overall num: 9*)

4. Sectioned cut, viewed from side/front at slight angle (*Overall num: 10*)

5. Same view as last one, but with full membrane cartridge assembly now added to show progression of assembly (*Overall num: 11*)

6. Same as number 5, but without the section view (i.e. full perfusion satellite assembly)
(Overall num: 12)

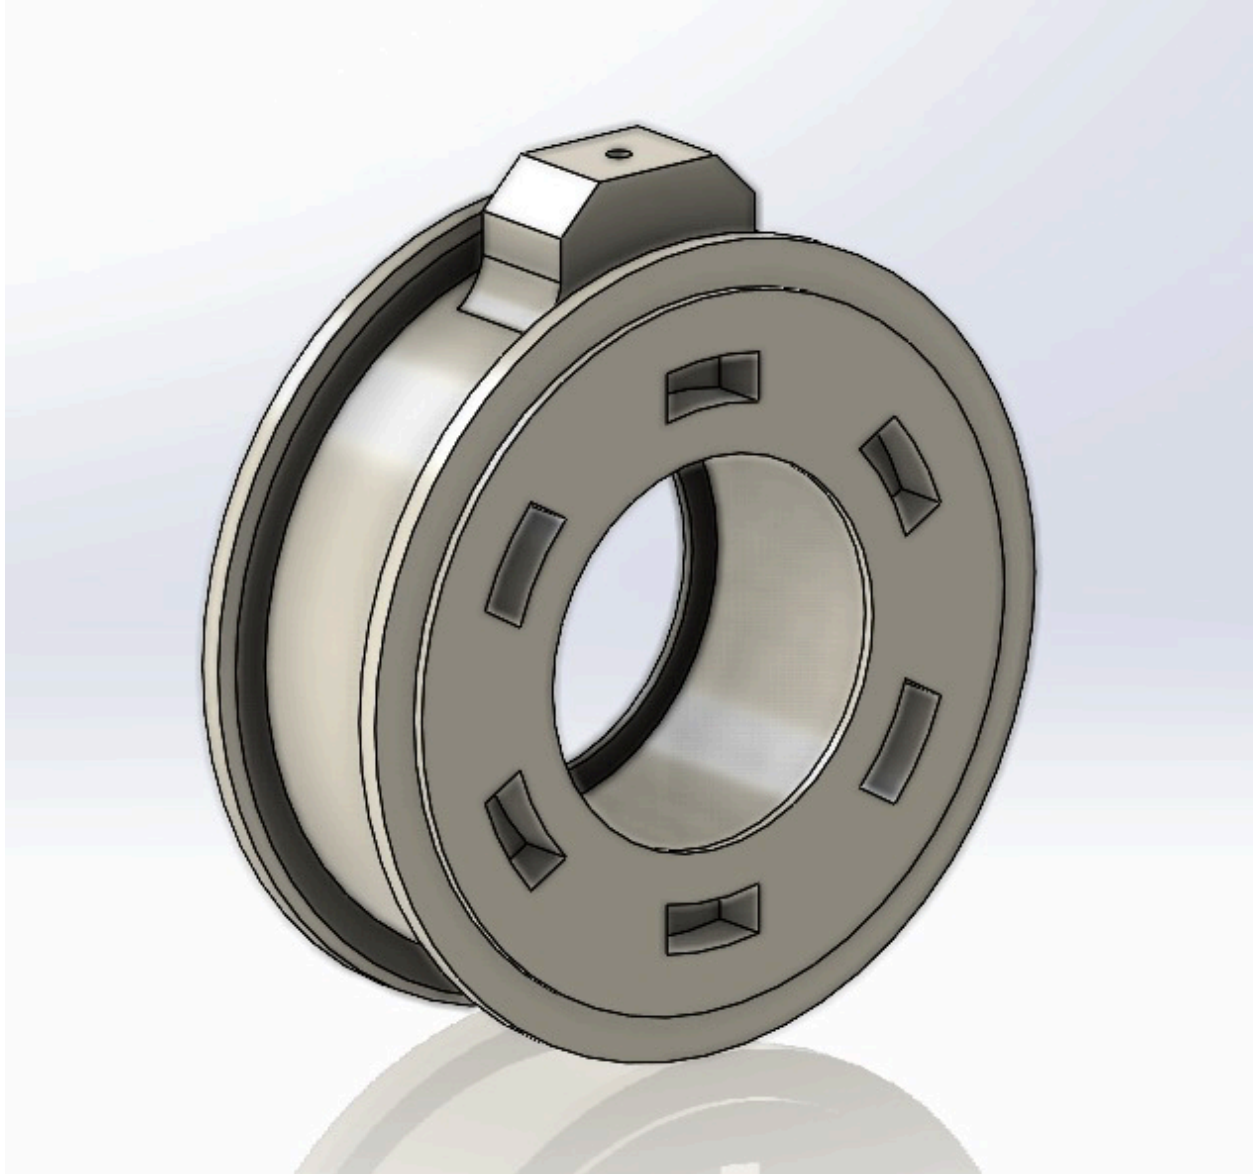

BACTERIA SATELLITE:

Same as the perfusion chamber, just a bigger chamber volume (~5x larger).

DRUG HUB:

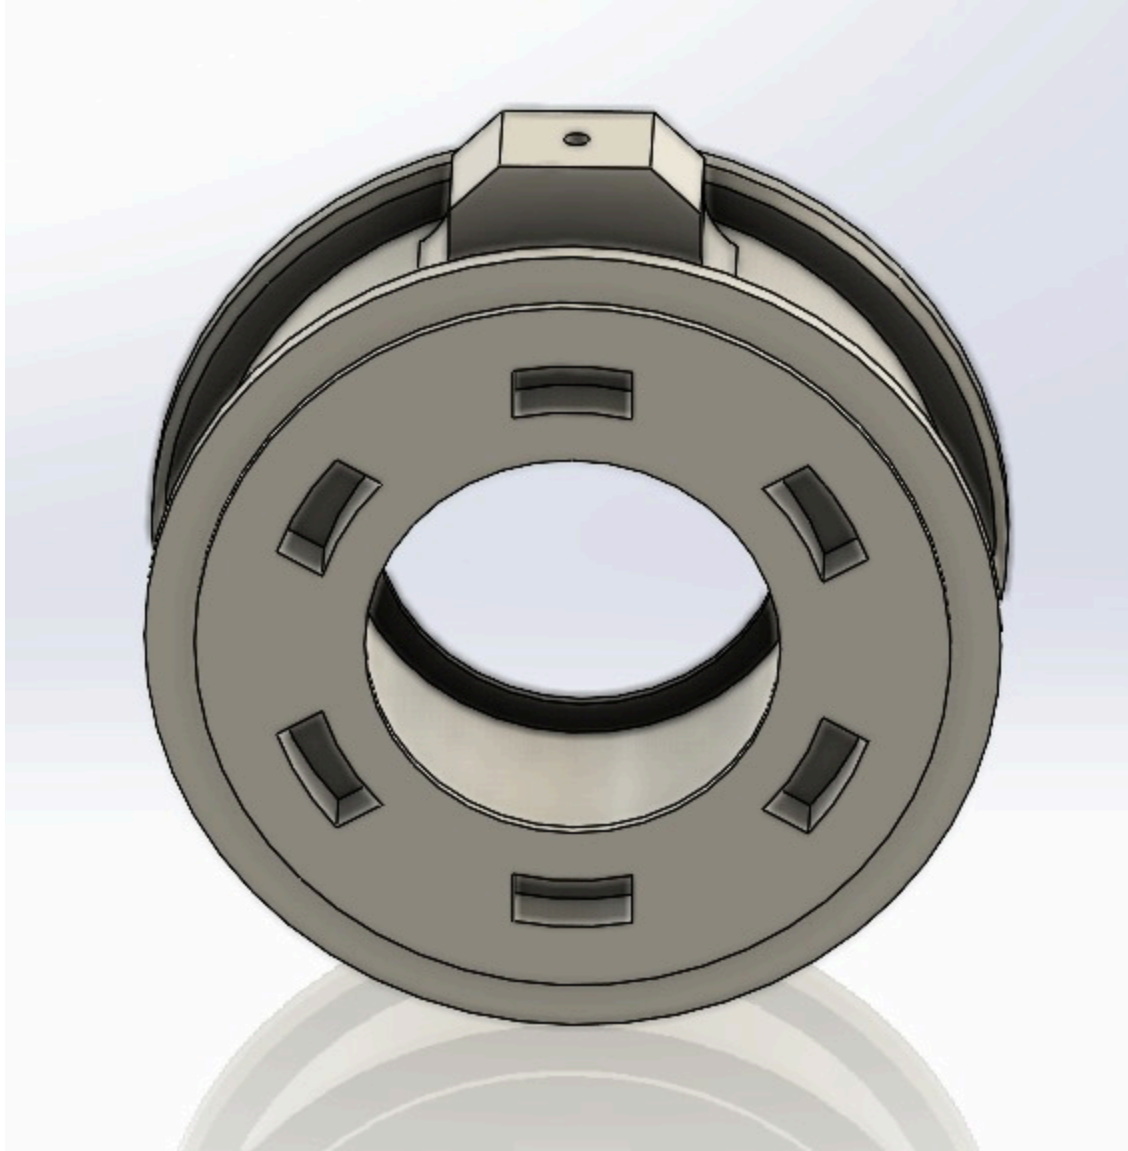

1. Side / frontal view (*Overall num: 13*)

2. Top-down, bird's eye view (*Overall num: 14*)

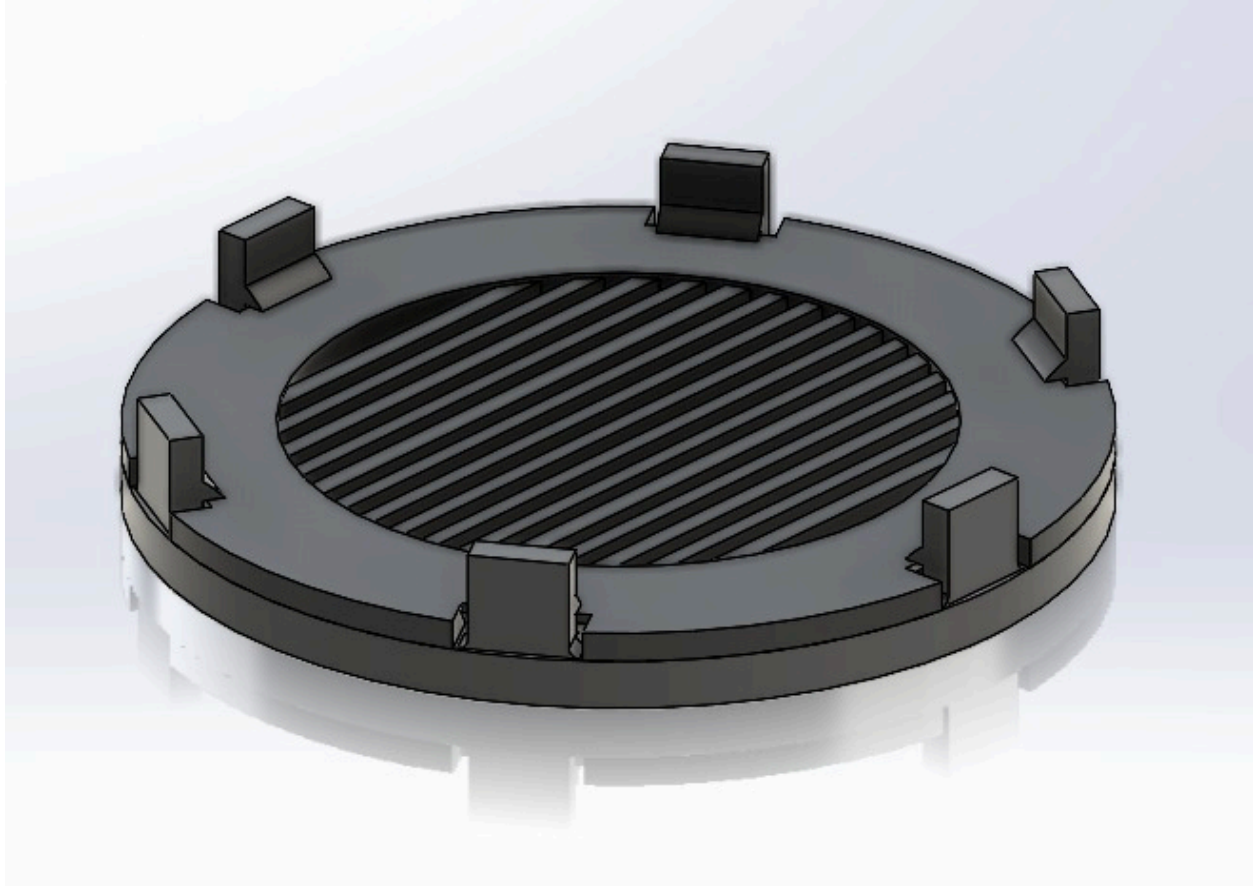

3. View from the front (*Overall num: 15*)

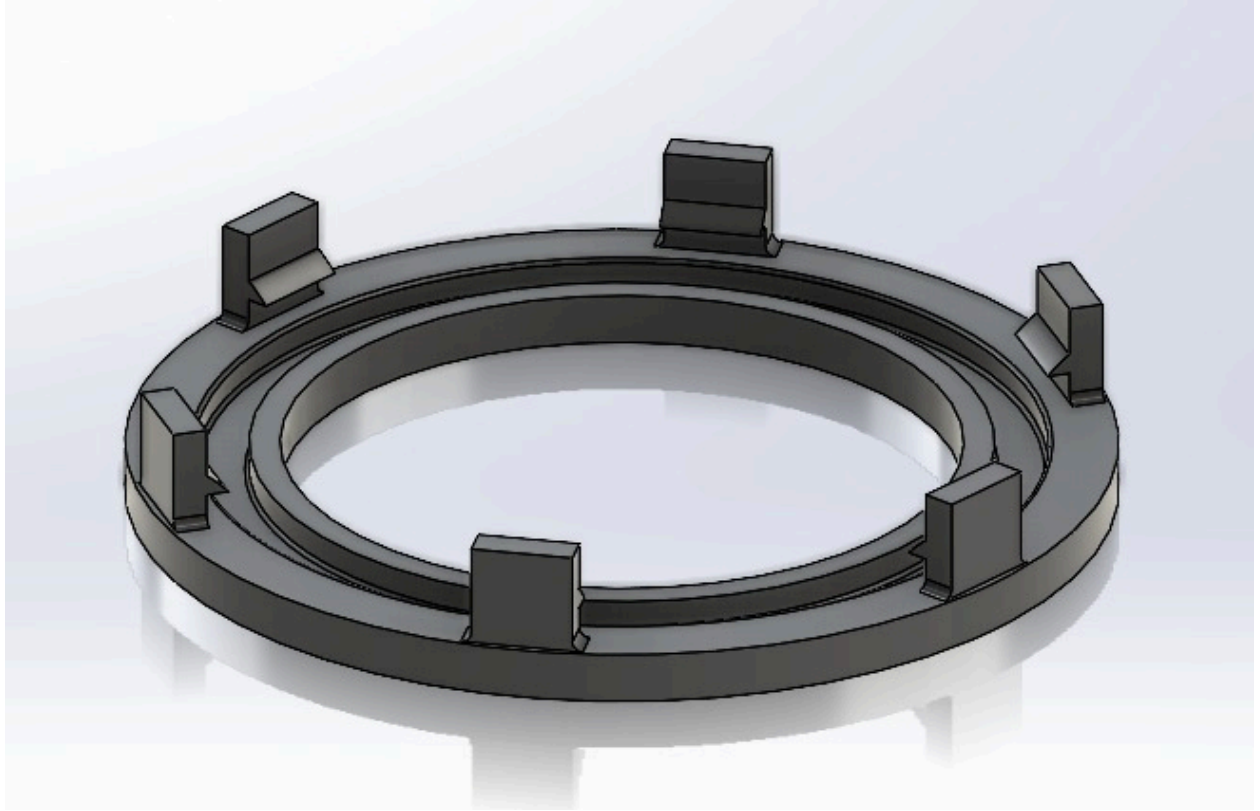

MEMBRANE CARTRIDGE:

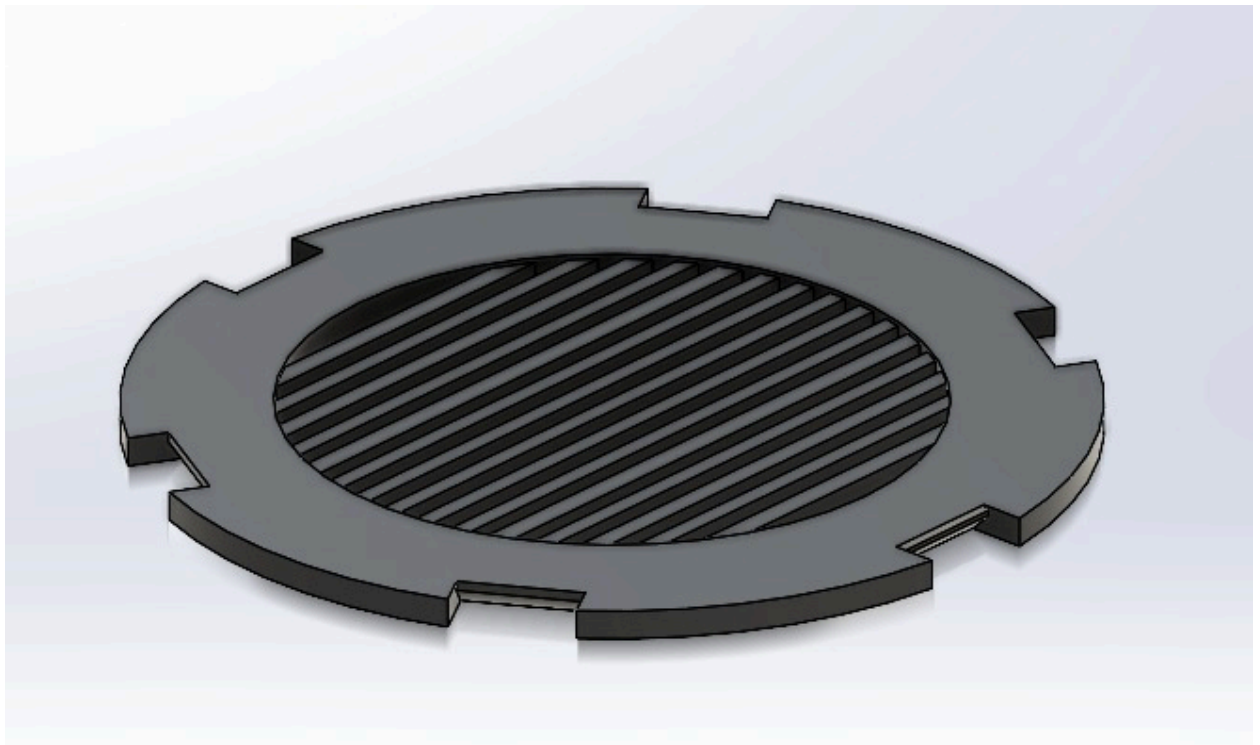

1. View from the top but from the side (*Overall num: 16*)

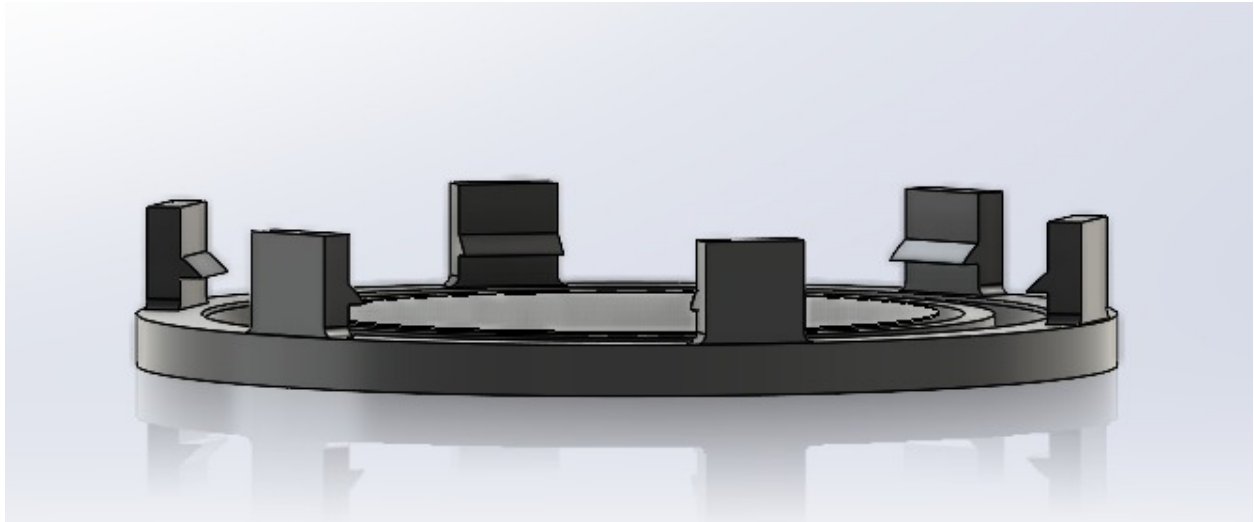

2. Cartridge base only (*Overall num: 17*)

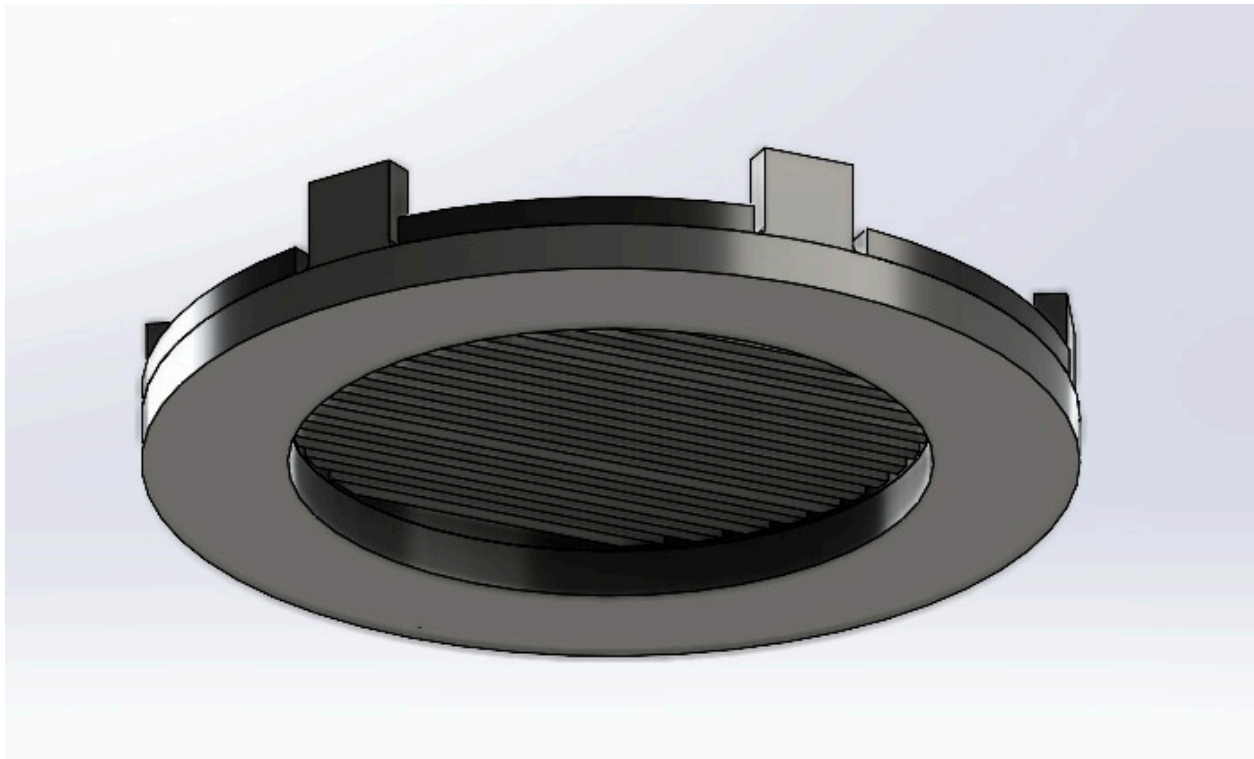

3. Cartridge lid only (top/side view): (*Overall num: 18*)

4. Cartridge BASE (not lid like last time) only, side view (*Overall num: 19*)

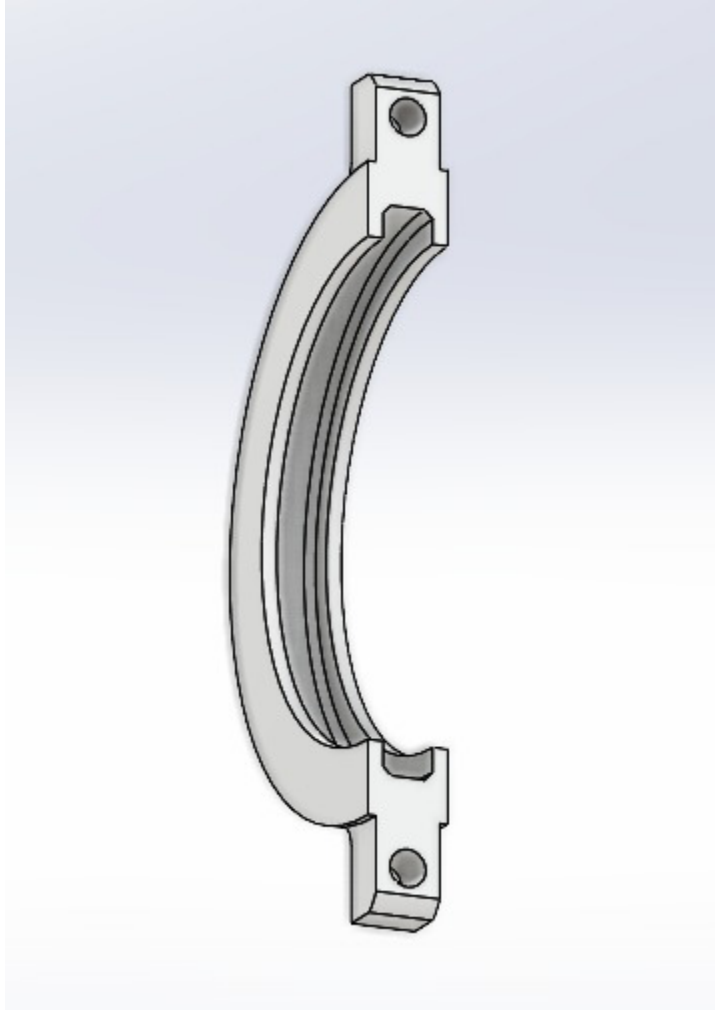

5. Full membrane cartridge to show entire assembly, but from the bottom/side (*Overall num: 20*)

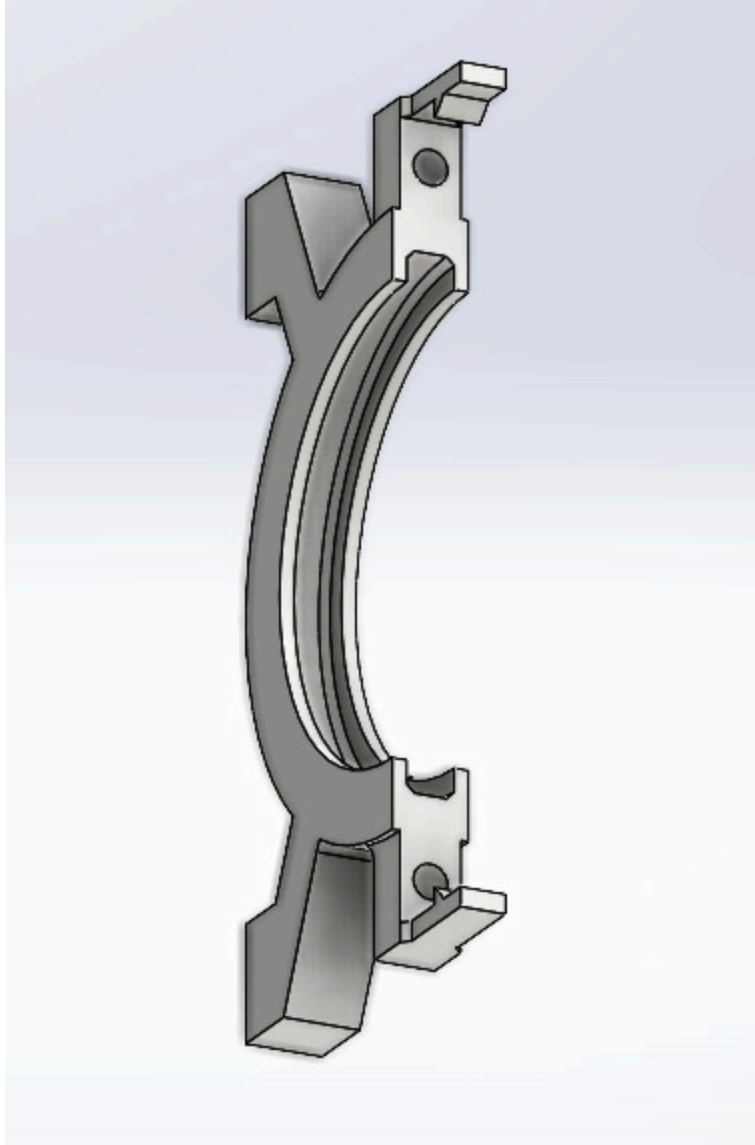

NEW C-SHAPED WRAPPER MODULE:

1. Isometric-ish view of TOP c-ring (no legs) (*Overall num: 21*)

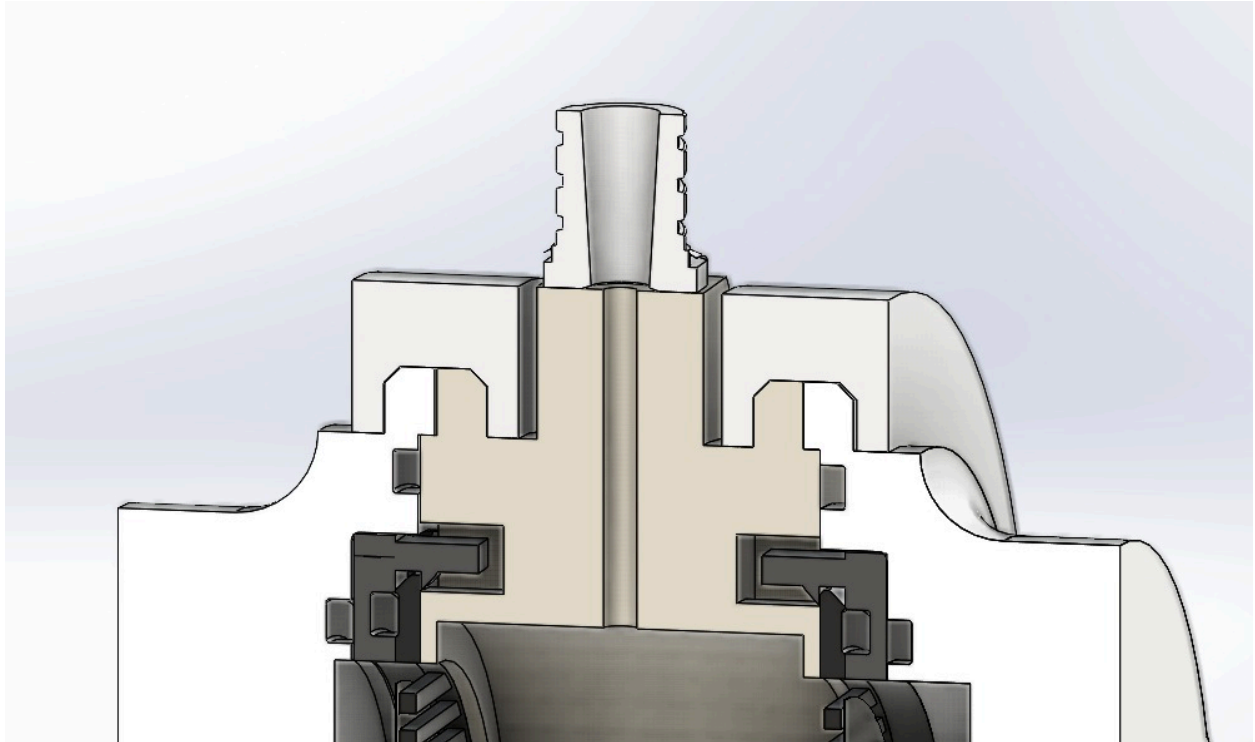

2. Isometric-ish view of BOTTOM c-ring with supporting legs and new latches (*Overall num: 22*)

3. Close-up of inverse U-shaped meeting point and how the wrappers ensure both even radial pressure/watertight sealing between the central drug hub and each of the satellites on either side of it (AS WELL AS doubling as pressure-point providers for the cartridge due to their extended “lip” (see annotated diagram) on this image, such that the cartridge cannot fall out and is firmly pressed (teeth are inserted strongly; thus, o-rings at all three levels (intra-cartridge, cartridge-satellite, and satellite-drug hub) are receiving uniform, sustained pressure that is enough to properly water-tight seal everything + prevent outside contaminants from coming in as well)

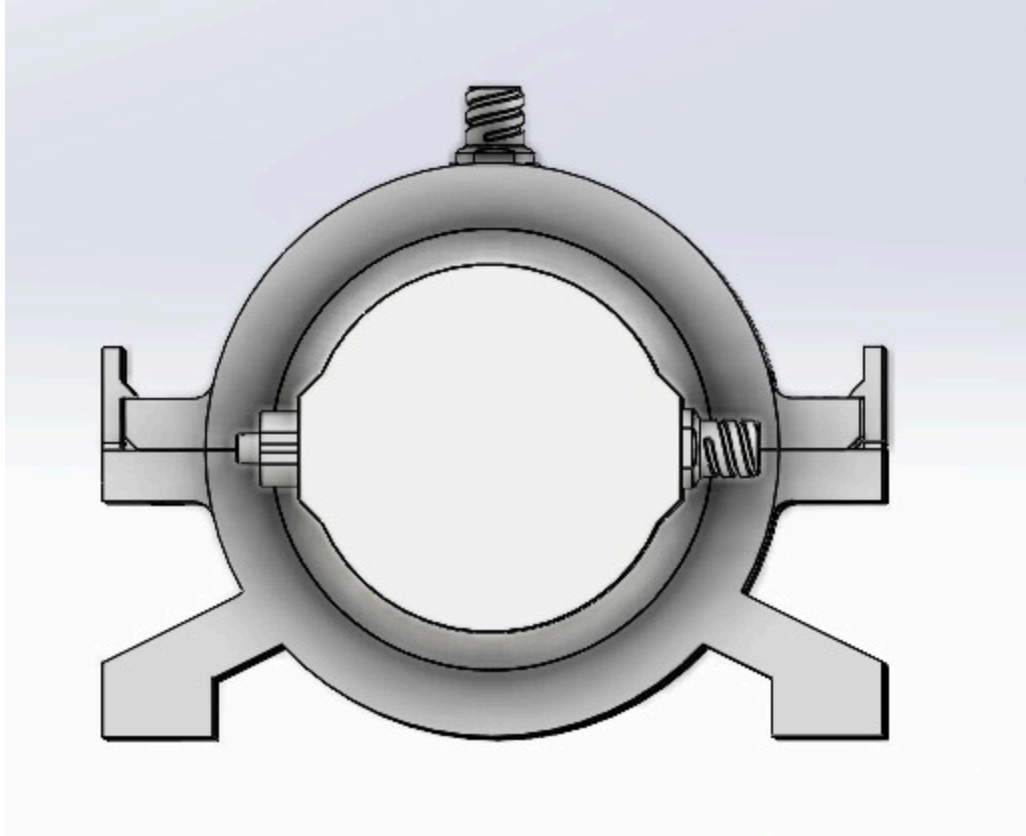

(Overall num: 23):

Some notes: Better c-rings (bottom supporting mechanism, free-standing -> saved material and better mechanical structure), and new latching mechanism as well (incorporating lessons from membrane cartridge, which worked well. still left screw holes for redundancy and extra tightening if needed for watertightness. woo

View from the side of entire assembly (to see legs provided by c-ring and compactness provided by the new design -> as well as latch mechanism on each side):

(Overall num: 24)

Latching mechanism close up (between two wrapping c-rings) (Overall num: 25)
